Mr. W. B. can now offer seed of this beautiful free-flowering, neat-growing species. Its handsome and elegant flowers are borne on long stalks and have a slightly distended tube, which is suddenly bent upwards, the upper part dilated into a cordate cup-shaped limb of a rich dark purple colour, ornamented throughout with irregular branched markings of a creamy white, and having a golden yellow eye surrounded by rich velvety purple. Its blossoms are produced in the greatest profusion, even on small plants, and are entirely free from the objectionable odour peculiar to the genus. It has been certificated by the Royal Horticultural Society, and is described and figured in the *Gardeners' Chronicle* for September 5th, 1885.

A new perennial herbaceous Primrose from the higher ranges of the Himalayas, where it was found growing in exposed places amongst rocks; the plant will therefore be quite hardy and from its stately growth, attaining, as it does, a height of 1½ to 2 feet, cannot fail to become one of the most desirable of the genus, for the adornment of the herbaceous border and rock garden. RHEUM NOBILE.

This plant is beautifully illustrated in Plate XIX. of *Illustrations of Himalayan Plants* from Mr. Cathcart's Drawings. It is thus described by Dr. Hooker: "The individual plants of *Rheum nobile* are upwards of a yard high, and form conical towers of the most delicate straw-coloured, shining, semi-transparent, concave, imbricating bracts, the upper of which have pink edges; the large bright glossy shiny green radical leaves, with red petioles and nerves, forming a base to the whole. On turning up the bracts, the beautiful membranous fragile pink stipules are seen, like red silver-paper, and within these again the short-branched panicles of flowers." The plant occurs in Sikkim, at an elevation of from 13,000 to 15,000 feet. "I first saw it," remarks Dr. Hooker in the work above alluded to, "from a distance of fully a mile, dotting the black cliffs of the Lachen valley at 14,000 feet elevation, in inaccessible situations, and was quite at a loss to conceive what it could be, nor was it till I had turned back the curious bracteal leaves and examined the flowers, that I was persuaded of its being a true Rhubarb." Seed of this remarkable plant is now offered for the first time.

In sealed Packets, 2*s.* 6*d.* each.

* Hardy annuals most suitable for autumn sowing.

TIME OF SOWING.

HARDY ANNUALS may be sown in March and April, and for early spring blooming those marked with an asterisk should be sown early in September, in a sheltered situation, and when up, thinned so as to keep them strong. In March they may be transplanted where they are to bloom. Before sowing, which should be done on a fine dry day, carefully prepare the soil, and in covering, regulate the thickness by the size of the seeds—small seeds should be very lightly covered. Success in growing annuals depends in a great measure upon their being properly thinned to regular distances, so as to give plenty of room for the full development of each plant; this, in too many instances, is entirely neglected, hence the dissatisfaction so often expressed as to their use.

HALF-HARDY ANNUALS may be sown in March and April, in pans, placed on a slight hot-bed, and, when strong enough, pricked out into a cool frame near the glass, where they may get hardened and well established for transplanting into their blooming quarters early in May, or potted off singly for conservatory and greenhouse decorations. Under favourable circumstances many varieties will bloom freely if sown in the open ground about the middle of May.

TENDER ANNUALS such as Balsams, Celosias, Thunbergias, &c., require raising in a temperature ranging from 60° to 70°. Sow in pans or pots, and place near the glass; keep the soil moist, and shade from the sun until the plants appear. When strong enough, pot off into small pots, keeping them near the glass, and admitting air on every favourable occasion.

BIENNIALS AND PERENNIALS.—The more select and tender varieties for summer and autumn blooming may be sown in a gentle heat in March and April, and pricked out into pots until fully established, and then potted off singly, or transplanted into the open ground, as required. The hardier varieties may be sown in the open ground, in prepared beds, in June and July, and when strong enough transplanted into nursery beds, or where they are intended to bloom the following year.

CHOICE COLLECTIONS OF FLOWER SEEDS.

As in Flower Seeds new species or varieties and improved strains are being constantly imported, proved, or raised, and offered by Mr. William Bull, it naturally follows that giving mere names and descriptions convey in many instances but an inadequate idea of the desirability of some of the handsomest and best introductions. Collections of Flower Seeds are therefore made comprising the choicest strains of popular favourite flowers, and including selections of the best novelties.

Quality rather than quantity being especially considered—Mr. W. B.'s selections may safely be relied on in these Collections.

NOVELTIES IN VEGETABLE SEEDS.

SUMMER CABBAGE LETTUCE, NEW YORK.

SUMMER CABBAGE LETTUCE, NEW YORK.

This is a remarkable New Summer Cabbage Lettuce, with but little tendency to run to seed. It is unusual for size and solidity of head, which blanches itself naturally, is crisp, tender, of excellent flavour, and entirely free from bitterness. Very distinct and one of the best Summer Cabbage Lettuce ever introduced. *Vide* illustration.

In Packets, 1*s*. each.

NEW TOMATO, MIKADO.

A variety which has given the greatest satisfaction in the United States, where it is hardly necessary to state, the Tomato attains high perfection. The fruits of this desirable variety grow to a large size, frequently weighing as much as a pound and a half each, and are of good flavour. The foliage is distinct, being whole or entire, instead of cut or serrated as in nearly all other sorts.

In Packets, 1*s*. each.

SPIRÆA ASTILBOIDES.

One of the most handsome of hardy herbaceous perennials, and one which has been certificated both by the Royal Horticultural and Royal Botanic Societies on account of its great merit. The stems are furnished with triternate leaves, and terminated by compound feathery branches of elegant white flowers. It will be a charming and indispensable plant for pot culture as a decorative object in the early spring months, on account of its free growth and beautiful flowers, which are produced in the greatest profusion. This is one of the Twelve New Plants with which Mr. W. B. gained the First Prize at the Great Show of the Royal Horticultural Society, held at Kensington, in 1882. *5s.*

GLADIOLUS.

(HYBRIDS OF GANDAVENSIS.)

There are few flowers more showy and beautiful than the Gladiolus, and the varieties of the *Gandavensis* section are perfectly hardy and easily grown, whilst their erect and stately growth, and long spikes of flowers, developing themselves successively, never fail to win admirers.

To facilitate the cultivation of this highly decorative plant, a few remarks may be necessary to some :—

The best and safest time for planting is from the beginning of April to the end of May, when a continuous bloom may be assured from July to September.

Soil is not much a point for consideration, so long as it is not stiff and consolidated; but it is important that it should be deeply dug previous to planting.

Large bulbs should be planted from 3 to 4 inches, and smaller bulbs 2 inches deep.

During excessively dry weather, copious waterings are recommended.

When any bulbs show signs of growth before the time mentioned above, they should be potted and kept in a cool frame until the proper season for planting out.

CHOICE GLADIOLUS.

This beautiful tribe of plants should be largely planted everywhere, because—

They are perfectly hardy and easily grown.

They are gorgeously beautiful.

Their handsome spikes of flowers are useful for decorating vases and epergnes.

Their flower buds expand and last a long time when cut and placed in water.

They are charming when introduced into borders among Evergreens.

Planted by hundreds among Rhododendrons, they brighten and enliven the beds during the summer and autumn months.

Orders for the above are booked throughout the year at the following prices, and the bulbs supplied in January, February or March.

By successional plantings these lovely flowers may be had all through the summer and autumn.
